Into Complexity Nov 30 2019 The NWO-programme "the societal aspects of genomics", has called for stronger means of collaboration and deliberative involvement between the various stakeholders of genomics research. Within the project group assembled at the UH, this call was translated to the 'lingua democratica', in which the prerequisites of such deliberative efforts were put to scrutiny. The contribution of this thesis has taken a more or less abstract angle to this task, and sought to develop a vocabulary that can be shared amongst various stakeholders

with different backgrounds, interests and stakes for any complex theme, although genomics has more or less been in focus throughout the research. As 'complexity thinking' is currently a theme in both the 'hard' sciences as the social sciences and the humanities, and has always been an issue for professionals, this concept was pivotal in achieving such an inclusive angle. However, in order to prevent that complexity would become fragmented due to disciplinary boundaries, it is essential that those aspects of complexity that seem to return in many discussions would be made clear, and stand out with respect to the complexities of specialisation. The thesis has argued that the concept of 'patterns' applies for these aspects, and they form the backbone of the vocabulary that has been developed. Especially patterns of feedback have been given much attention, as this concept is pivotal for many complex themes. However, although patterns are implicitly or explicitly used in many areas, there is little methodological (and philosophical) underpinning of what they are and why they are able to do what they do. As a result, quite some attention has been given to these issues, and how they relate to concepts such as 'information', 'order' and complexity itself. From these explorations, the actual vocabulary was developed, including the methodological means to use this vocabulary. This has taken the shape of a recursive development of a so-called pattern-library, which has crossed disciplinary boundaries, from technological areas, through biology, psychology and the social sciences, to a topic that is typical of the humanities. This journey across the divide of C.P. Snow's 'two cultures' is both a test for a lingua democratica, as well as aimed to demonstrate how delicate, and balanced such a path must be in order to be effective, especially if one aims to retain certain coherence along the way. Finally, the methodology has been applied in a very practical way, to a current development that hinges strongly on research in genomics, which is trans-humanist movement.

Software for Use Jan 31 2020 In the quest for quality, software developers have long focused on improving the internal architecture of their products. Larry L. Constantine--who originally created structured design to effect such improvement--now joins with well-known consultant Lucy A. D. Lockwood to turn the focus of software development to the external architecture. In this book, they present the models and methods of a revolutionary approach to software that will help programmers deliver more usable software--software that will enable users to accomplish their tasks with greater ease and efficiency. Recognizing usability as the key to successful software, Constantine and Lockwood provide concrete tools and techniques that programmers can employ to meet that end. Much more than just another set of rules for good user-interface design, this book guides readers through a systematic software development process. This process, called usage-centered design, weaves together two major threads in software development methods: use cases (also used with UML) and essential modeling. With numerous examples and case studies of both conventional and specialized software applications, the authors illustrate what has been shown in practice to work and what has proved to be of greatest practical value. Highlights Presents a streamlined process for developing highly usable software Describes practical methods and models successfully implemented in industry Complements modern development practices, including the Unified Process and other object-oriented software engineering approaches

Advances in Case-Based Reasoning Sep 28 2019 The 7th European Conference on Case-Based Reasoning (ECCBR 2004) was held from August 30 through September 2, at the Complutense University of Madrid, Spain. ECCBR was born in Aberdeen, UK (2002), after a series of European workshops held in Trento, Italy(2000), Dublin, Ireland(1998), Lausanne, Switzerland (1996), Paris, France (1994), and Kaiserslautern, Germany (1993). ECCBR is the premier international forum for researchers and practitioners of case-based reasoning (CBR) in the years interleaving with the biennial international counterpart ICCBR, whose 5th edition was held in Trondheim, Norway in 2003. The CBR

community has shown for years a deep interest in the application of its research to real-world problems. As a result, the first day of both ECCBR and ICCBR has been traditionally dedicated to presenting industrial CBR complications. ECCBR 2004 Industry Day was co-chaired by Mehmet Göker and Francisco Martín who invited professionals from different fields to describe their fielded CBR systems. The second day of the conference was dedicated to four workshops focusing on the following research interests: CBR in health sciences, explanation in CBR, computational creativity, and CBR applied to time series prediction. We are grateful to the Workshop Program co-chairs, Pablo Gervás and Kalyan Moy Gupta, for their efforts in coordinating these workshops, along with the individual workshop chairs and participants. Materials from the Industry Day and the workshops were published separately and can be obtained from the ECCBR 2004 website, [http://www. idt. mdh. se/ecibr](http://www.idt.mdh.se/ecibr).

7th Int. Conf. Industrial & En Jan 25 2022 Over the years, the promise of artificial intelligence has inspired many researchers and many schemes, only to have incipient hopes thwarted by its complexity. With each generation of computational engines, a new wave of enthusiasm sweeps the community as solutions to a few problems come within reach. However, intractability and undecidability continue to frustrate the unwary practitioner, while unsubstantiated methodologies offer ingenious solutions that hold more promise than potential. Despite its undulate past and variegated present, AI has made solid contributions to a growing information technology. Expert systems and allied tools have become a mainstay of industrial and business organizations; intelligent interfaces have increased accessibility of computational resources; and robotic innovations have redefined the manufacturing industries. Meanwhile, research in evolutionary algorithms, neural networks, fuzzy reasoning, and other exciting approaches promise continued progress in surprising new directions. These proceedings record the latest results of

industrial, commercial, military, and academic artificial intelligence exploration. Seventy-seven papers divided into twenty different areas document a significant slice of this broad and exciting field. Although dozens of themes are treated in the papers, the topical divisions of this volume comprise: The Software Engineering/AI Interface, Knowledge-Based Systems. Temporal Reasoning, Machine Learning, Robotics, Intelligent Databases, Planning, Expert Systems Applications, Search Techniques, Genetic and Evolutionary Methods, Design, Qualitative Reasoning, Neural Networks, Knowledge Representation, Application Paradigms, Fuzzy and Pattern Recognition, Reasoning about Physical Systems, Parallel and Distributed AI, and Diagnostic Systems.
